

Early gut microbiota recovery after auto-FMT in allo-HSCT recipients

Primary window: days 1–30; models adjust personal pre-HSCT alpha, pre-index damage and randomization day, with patient-level resampling.
Descriptive sustained recovery to at least 80% of personal alpha baseline by day 30: 6/13 auto-FMT versus 1/8 control (Fisher's exact P = 0.174); index-day stools were excluded.
